Box It Now™ User Integration and Merging

Notes: Refer to API documentation for specific endpoint integration

Integration Path:

For clarity this doc refers to **BIN User** as a user created through Box It Now API, **Site User** refers to a user account with the integration site.

For every S**ite User** there should be a corresponding **BIN User** when there is widget integration needed**.**

- Flow 1:
  - Existing Client logs into site or creates a Site User account
    Use API endpoint **/registration** to create a new BIN User. A random password can be used and stored in association of the **Site User** account.

    Set RegisterForm[activate] = true, during registration.

    Use API endpoint **/login** to get a user token to use on the widget integration

- Flow 2:
  - New Temporary Guest BIN User, user without an associated Site User
    When user enters site without a **Site User** account with new session, create a temporary user to store graphics and designs. Later this user can be merged into an existing user, or made into a permanent user.

    Call api endpoint **/registration**

    Set RegisterForm[activate] = true

    Set RegisterForm[emphemeral] = true

    Use **/login** to create user login **token** to pass to client side widget integration

- **Merge Guest BIN User with existing BIN User**

  If a Guest BIN User account needs to be merged with an existing BIN User associated with a Site User, then use this merge process.

  Call api endpoint **/merge**

  Pass the Guest BIN User account credentials, and the existing BIN User account credentials

- **Make Guest BIN User a permanent BIN User**

  If a guest BIN User needs to be made into a permanent BIN User in case of a Site User account being created use the following.

  Call api endpoint **/makePersistent**

  Pass the existing Guest BIN User credentials

  Pass the new username associated with the account.
